

Activault™ – Advanced File Management Software – Version 4.1 for SolidWorks®

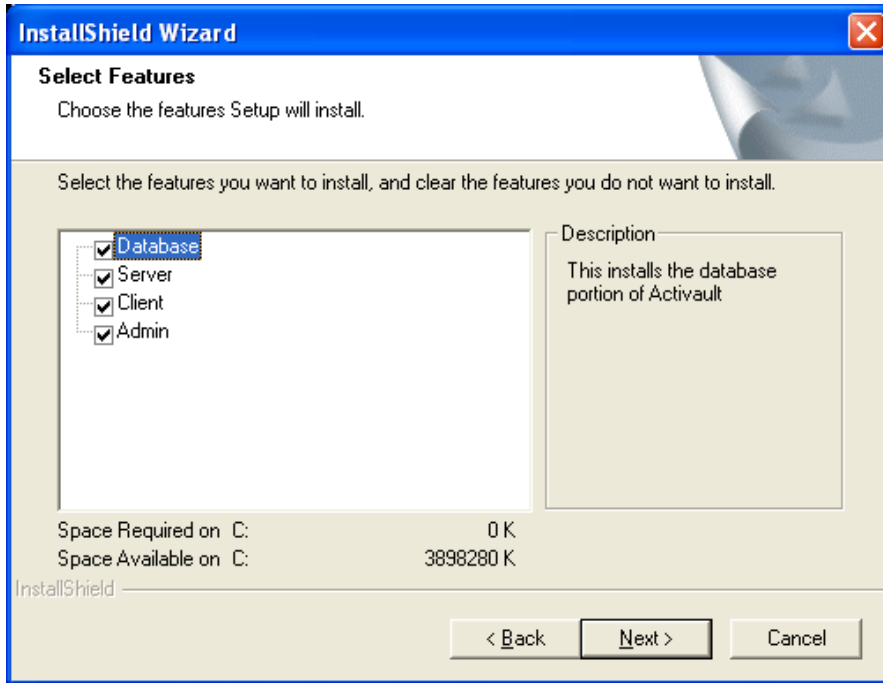

There are several PDM systems available for SolidWorks; however, Activault is the one that will get used. PDM normally stands for "Pretty Darn Mad" but Activault is different. It was originally developed by Agile Software in 1998 and since then has gone through several major improvements and a change in ownership. Today, SolidPartners Inc., one of the first Gold Partners with SolidWorks Corporation, has unveiled the newest version of Activault with several key features that place it at the top of the PDM pyramid:

Secure Vaulting – no one outside of the Activault application can inadvertently access your files. As an SQLServer based application – Searching is quick and easy no matter how large your organization grows.
Ease of Use – Windows & SolidWorks Native application – all commands are intuitive and quick to learn.
Easy to Support – Activault is easily installed and maintained by CAD engineers- not computer/database programmers. We back up our claims with some of the most talented professionals in the industry and toll-free technical support.

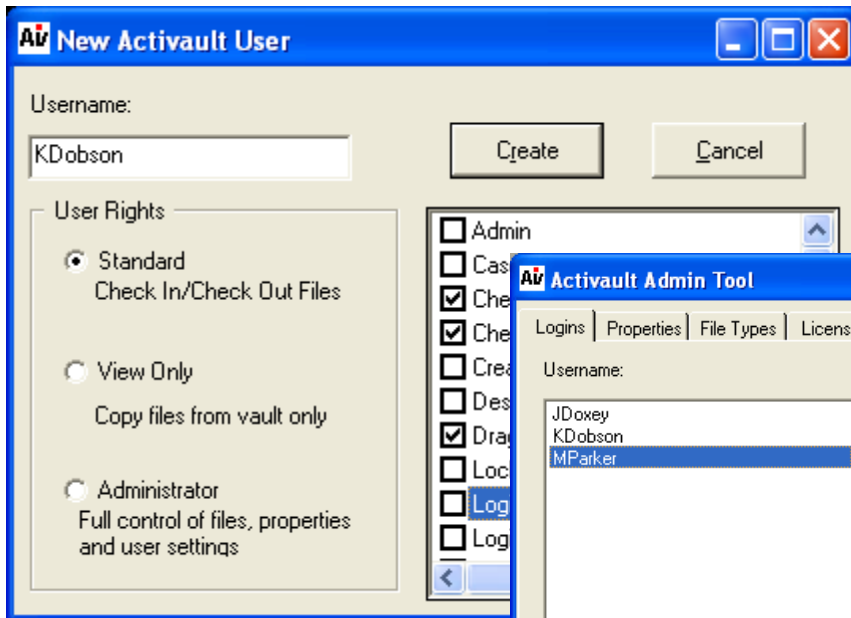

New for 2005:

- Support for any file type including Word, PDF, XLS, DWG, Specs, FEA, etc.
- Multi-location vaulting and file-synchronization.
- Required fields upon check-in: the administrator can set custom properties to be required, preventing users from checking in files without the necessary attribute information.
- Read-only access for non-SolidWorks users.
- User level controls prevent unauthorized access to Activault commands including Lock, Release, Check-out/Check-in, Delete, Undelete, Drag and Drop, etc.
- Extensive search capabilities – All custom properties stored in the files in Activault are accessible via the search dialog. You can search in seconds thousands of file attributes to retrieve the correct file.

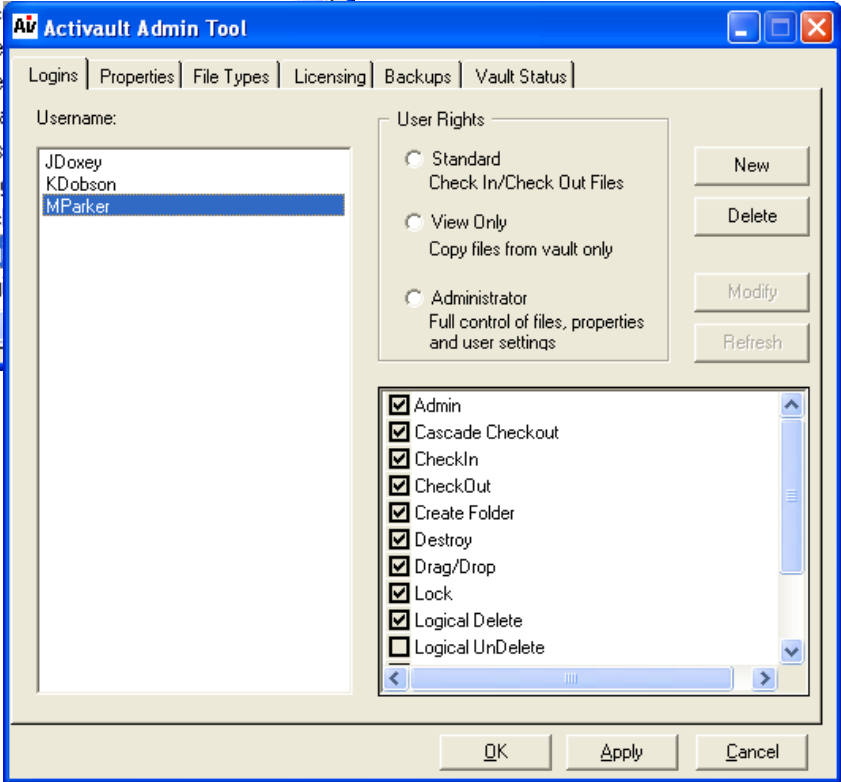

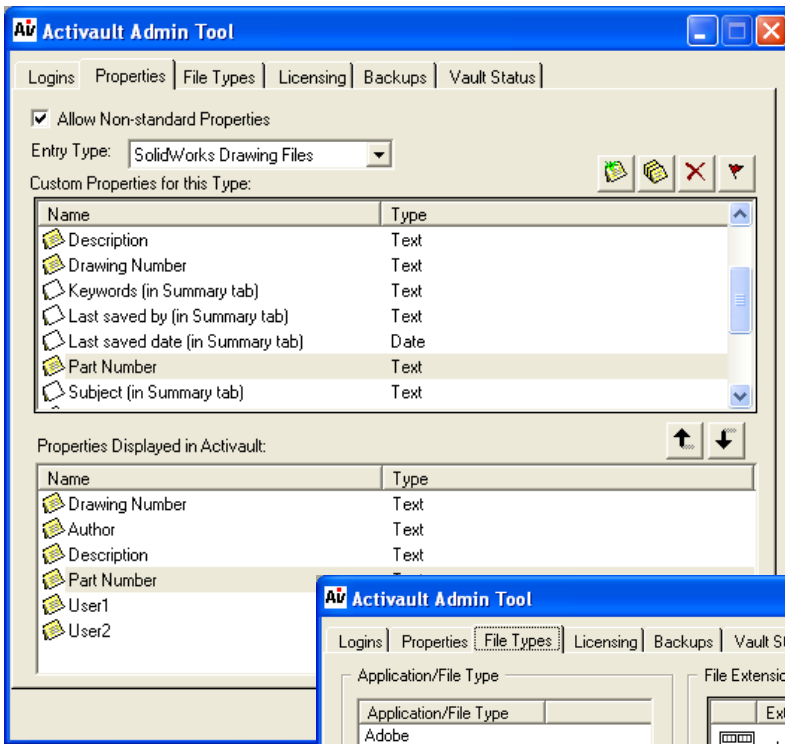

The Activault installation can be run in a few minutes and does not require a data base administrator to maintain – no programming is required

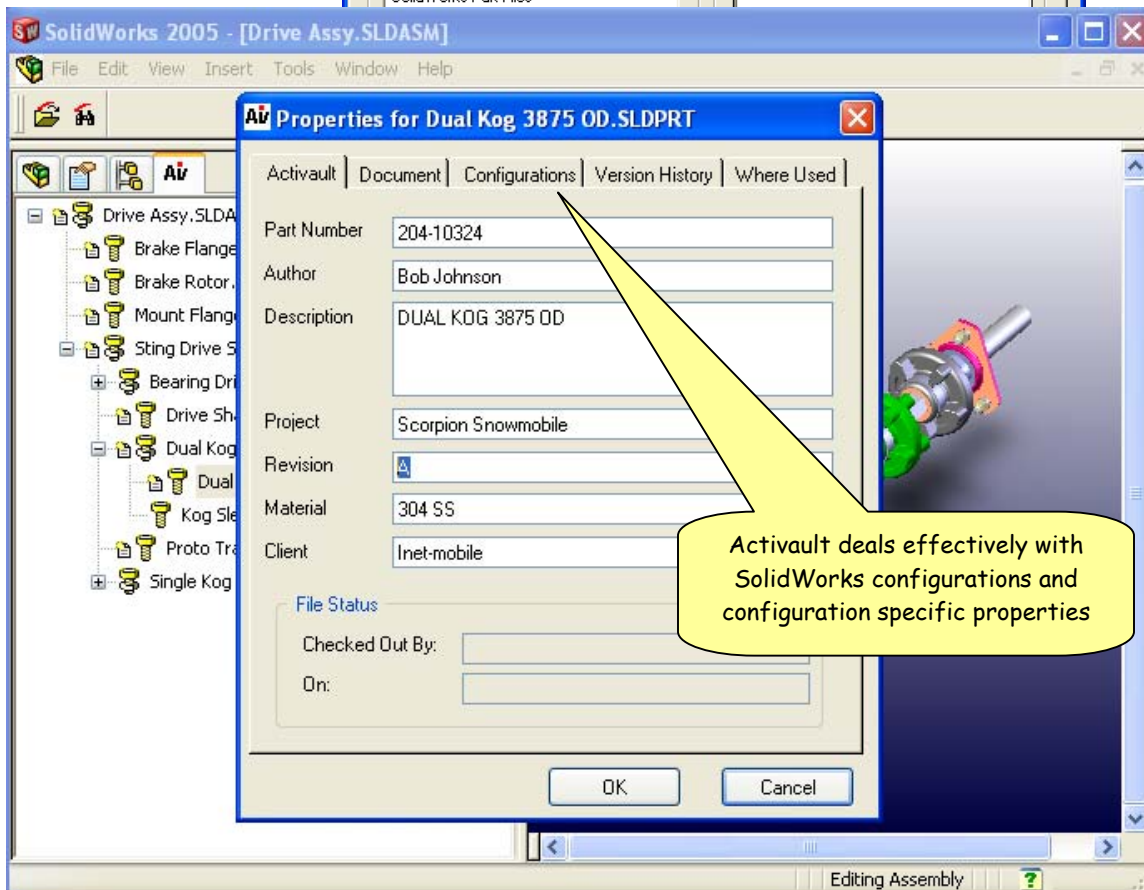

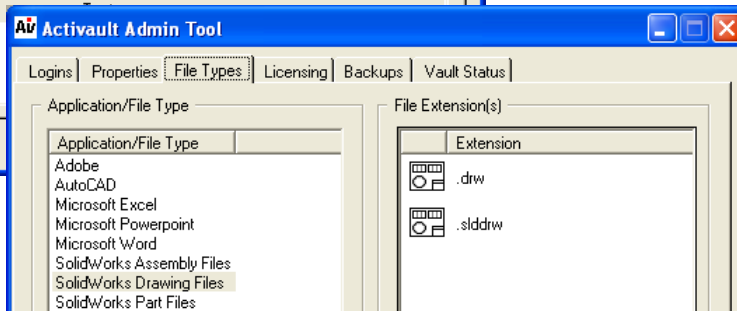

Upon installation, the Activault Administrator program allows the admin user to set up others to use the vault and grant them privileges.

Each file type can have unique custom properties associated within the file. Activault uses the "custom properties" of any windows file to create searchable attributes. These attributes are managed in the Activault Administrator program. Any attribute can be set to a *required* status.

Simple drag and drop creates the properties (attribute labels) displayed in Activault. All file custom properties can be searched whether they are displayed or not in the Activault tab in SolidWorks. Remember, no programming is necessary and you can be up and running in minutes!

Activault consists of two new icons (open and search) in SolidWorks and the "files-tree view" to see what files are required in assemblies or drawings. It also provides status on the files in the vault.

SolidWorks is a registered trademark of SolidWorks Corp. Activault is a trademark of SolidPartners, Inc. All other trademarks are acknowledged.

Activault users can drag and drop files into the *Open from Activault* dialog, thereby "checking in" any type of Windows file into the secure vault.

Multiple files/versions can be checked into the vault without manually changing the names of the files in the vault

File history and where a file is used (parents as well as children) is automatically captured upon check in.

Activault is the simplest, most powerful PDM system available for SolidWorks users. See for yourself – visit SolidPartners.com to request a demonstration or talk with your SolidWorks reseller today! Tel: 800-605-3831
